## Overview

This publication is the sixth Fruit Summary in the series of “**Agricultural Chemical Usage**” reports issued by the National Agricultural Statistics Service (NASS). These reports contain statistics for the on-farm use of agricultural chemicals. Other chemical usage publications recently issued have focused on agricultural chemical use on vegetables (July 2001) and field crops (May 2002).

Information in this report is provided from a survey funded by the USDA Pesticide Data Program. The purpose of the Pesticide Data Program is to provide reliable pesticide use statistics and to enhance the quality of information on pesticide residues in food. Multiple agencies within the USDA administer this program. This data series addresses the increased public interest in agricultural chemical use and provides the means for government agencies to respond effectively to food safety and water quality issues.

This report includes farm use of pesticides for the 2001 crop year for selected fruit crops in 11 major producing States. In addition, Kansas was surveyed for chemical use on apples and grapes with funding from outside sources. The previous report on fruit crops, published in 1999, also featured pesticide usage data for nut crops; however, due to budget constraints, nut crops were not surveyed for this report.

This is the second report that includes pesticide usage data on grapes in California, by utilization - table, raisin or wine. In addition, usage data for non-bearing grapes in California are included in this publication.

## Highlights

**Apples:** Insecticide applications were made on 95 percent of the apple acreage in the eight Program States. The most commonly used insecticides were azinphos-methyl and petroleum distillate. Fungicides were applied to at least 82 percent of the acreage in six of the eight Program States. Myclobutanil was the fungicide most commonly used, and it was applied to 37 percent of the acreage. Herbicides were applied to 52 percent of the acreage overall and ranged from 8 percent of the acreage in North Carolina upwards to 66 percent in New York.

**Apricots:** Herbicides were applied to 24 percent of California’s apricot acreage, while insecticides and fungicides were applied to 79 and 74 percent of the acreage, respectively. Esfenvalerate, applied to 49 percent of the acreage, was the most widely used insecticide, followed by petroleum distillate at 38 percent. Only one fungicide was applied to at least 30 percent of the acreage: iprodione at 31 percent. Glyphosate was the most commonly used herbicide, applied to 17 percent of the acres.

**Avocados:** Insecticide applications were made to 44 percent of California’s avocado acreage, with petroleum distillate most commonly used, on 32 percent of the acres. Herbicides were applied to 24 percent of the acreage. Other chemicals, such as growth regulators and rodenticides were applied to 6 percent of the acreage. There were insufficient reports to publish any herbicide, fungicide, or other chemical active ingredient data.

**Blackberries:** Herbicides, insecticides and fungicides were applied to Oregon's blackberry acreage in percentages ranging from 71 percent upward. The herbicides diuron and simazine were applied to 40 and 34 percent of the acreage, respectively. Paraquat was applied to 29 percent. Carbaryl was the most common insecticide in use and was applied to 32 percent of the acreage. The fungicide calcium polysulfide was the most widely used of all chemicals, being applied to 66 percent of the blackberry acres in Oregon.

**Blueberries:** Herbicides were applied on 65 percent of the blueberry acres in the four Program States. Insecticides and fungicides were used on 89 and 87 percent of the acreage, respectively. The most popular insecticide was phosmet, used on 52 percent of the acreage, followed closely by azinphos-methyl at 47 percent. For herbicides, diuron was the most commonly used, at 30 percent of the acres. Captan (63 percent of acres); benomyl (61 percent of acres); and ziram (45 percent of acres) were the three most commonly used fungicides.

**Cherries, Sweet:** Both insecticide and fungicide applications were made to 79 percent of the sweet cherry acreage in the four Program States. Herbicides were used on 41 percent of the acreage. California had the lowest percent coverage in each chemical class. The insecticide azinphos-methyl was applied to 37 percent of the acreage. In the fungicide class, myclobutanil was used on 37 percent of the acres. For herbicides, glyphosate was the most commonly applied and was used on 26 percent of the acres.

**Cherries, Tart:** Insecticides and fungicides were applied to virtually all of the tart cherry acreage in the two Program States, and herbicides were applied to 62 percent of the acreage. Azinphos-methyl was the insecticide applied to the most acres, at 88 percent. Chlorothalonil, at 96 percent, and sulfur, at 89 percent, were the most widely used fungicides.

**Dates:** Insecticides were used on 18 percent of California's date acreage. There were insufficient reports to publish any herbicide or fungicide usage data for the acreage in California.

**Figs:** California fig growers applied herbicides to 50 percent of the total acreage. Insecticides were applied to 11 percent of the acreage. There were insufficient reports to publish any insecticide or fungicide active ingredient data.

**Grapefruit:** Herbicides and insecticides were each used on 90 percent of the grapefruit acreage in the two Program States, followed closely by fungicides at 83 percent. Florida's growers used herbicides and insecticides on nearly all of the acreage, while California's growers treated only 62 percent of the acreage with herbicides and 41 percent with insecticides. Glyphosate and petroleum distillate were the most commonly used herbicide and insecticide, respectively.

**Grapes, All:** Fungicides were applied to more grapes on a higher percent of acres than were herbicides or insecticides in the five Program States. In the fungicide category, sulfur was the most commonly used material as it was applied to 79 percent of the acreage. Herbicide applications were made to 65 percent of the acres overall with glyphosate being the most commonly used, on 45 percent of the acreage. Percent of acres treated with insecticides was 60 percent. Imidacloprid was the leading insecticide and was in use on 24 percent of the acres.

**Grapes, Raisin:** Fungicides were applied to 78 percent of California's bearing raisin grape acreage, with sulfur, by far, the most commonly used. Herbicide applications were made on 59 percent of the acres, and glyphosate was the most widely used, at 38 percent. Insecticides were used on 59 percent of the raisin grape acreage. Cryolite was the most frequently used insecticide with 42 percent of the acres treated.

**Grapes, Table:** Fungicides were applied to 96 percent of California's bearing table grape acreage. Insecticides were used on 80 percent of the acreage. Other chemicals, including growth regulators, were applied to 76 percent of the acreage, followed by herbicides, which were used on 75 percent of the acreage. Glyphosate, imidacloprid and sulfur were the most popular herbicide, insecticide and fungicide, respectively.

**Grapes, Wine:** California's wine grape growers treated 87 percent of the bearing acreage with fungicides and 65 percent of the acres with herbicides. Insecticides were used on 58 percent of the acres, while only 9 percent of the acreage had other chemicals applied. The herbicide, glyphosate, was used on 47 percent of the acres. Imidacloprid was again the most commonly used insecticide. Sulfur, used as a fungicide, was applied to 85 percent of the acreage.

**Grapes, Non-bearing:** Herbicides were applied to 2 percent of California's non-bearing grape acreage. There were insufficient reports to publish data for the other pesticide classes or for any specific active ingredient used.

**Kiwifruit:** California's kiwifruit growers applied herbicides to 28 percent of the total acreage. The most commonly used herbicide was glyphosate.

**Lemons:** Slightly more than half of California's lemon acreage had herbicides and insecticides applied, and one-fourth of the acreage received fungicides. Glyphosate, petroleum distillate and basic copper sulfate were the most widely used herbicide, insecticide, and fungicide, respectively.

**Nectarines:** Fungicides were applied to 89 percent of the nectarine acreage in California, while 87 percent received insecticides and 70 percent of the acreage was treated with herbicides. Petroleum distillate and esfenvalerate were the most commonly used insecticides, based on acres treated. Glyphosate and copper hydroxide were the most widely used herbicide and fungicide, respectively.

**Olives:** Herbicides were applied to 38 percent of California's olive acreage, with glyphosate the most commonly used. Insecticides were used on 31 percent of the acreage. Spinosad was the leading insecticide applied to the crop. Fungicides were applied to only 6 percent of the California olive acreage.

**Oranges excluding Temples:** Herbicides were applied to 85 percent of the orange acreage in the two Program States, insecticides to 82 percent and fungicides to 48 percent of the acreage. Glyphosate, petroleum distillate and copper hydroxide were, by far, the most frequently used herbicide, insecticide and fungicide, respectively.

**Peaches:** Fungicide use was reported on 92 percent of the peach acreage in the five Program States. Michigan reported fungicide use on all of their peach crop. All other Program States ranged from 88 to 99 percent of the acres. Insecticides were applied to 91 percent of the acreage, with Georgia treating their entire crop. Herbicide use was reported on 59 percent of the peach acreage. New Jersey had the lowest percent treated, reporting use on only 45 percent of the crop.

**Pears:** Pear growers in the three Program States applied insecticides to 91 percent of the acreage, while fungicides were applied to 85 percent of the acres. Oregon applied insecticides to 97 percent of their acres, followed by Washington at 90 percent and California at 87 percent. Fungicides were applied to 96 percent of the Oregon acreage, with California and Washington at 81 and 80 percent of their acreage, respectively. Herbicides were applied to 49 percent of the acreage in the three States. California growers used herbicides on 60 percent of their pear acreage while the other two States treated 44 percent of their crop. An average of 56 percent of the acreage was treated with other chemicals, ranging from 50 to 62 percent, by State.

**Plums:** Insecticides were used on 85 percent of the plum acres in California. Petroleum distillate was used as an insecticide on 60 percent of the plum acreage. Fungicide usage was reported on 66 percent of the acreage, with propiconazole the most common, at 26 percent of the acres. Herbicides were applied to 60 percent of the plum acres. Glyphosate was the leading herbicide, used on 43 percent of the acreage.

**Prunes:** California's prune growers treated 58 percent of their acreage with insecticides. Approximately one-third of the acreage received herbicide and fungicide applications. Glyphosate, petroleum distillate and captan were the most commonly used herbicide, insecticide and fungicide, respectively.

**Raspberries:** Fungicides were applied to 94 percent of the raspberry acreage in the two Program States. Virtually all of Washington's acreage received fungicide applications. Herbicides were used on 89 percent of the Program States' acreage, and insecticides were used on 81 percent. Paraquat was the most commonly applied herbicide with 65 percent of the acres treated. Bifenthrin was the insecticide used most commonly and was applied to 64 percent of the acreage. Captan was the most widely used fungicide, at 76 percent, followed closely by cyprodinil and fludioxonil, each of which were used on 71 percent of the acreage.

**Tangelos:** Insecticides were applied to 86 percent of Florida's tangelo acres, followed by herbicides at 79 percent and fungicides at 71 percent. Petroleum distillate was, by far, the most commonly used insecticide, with 70 percent of the acreage treated. Glyphosate was the most popular herbicide, being used on 77 percent of the acreage. Copper hydroxide was the most widely used fungicide, applied to 53 percent of the acreage.

**Tangerines:** Herbicides and insecticides were each applied to approximately three-fourths of the bearing tangerine acreage in the two Program States. Fungicides were used on 62 percent of the acreage.

**Temples:** Insecticides were applied to nearly all of the bearing temple acreage in Florida. Herbicides and fungicides were put on 93 and 66 percent of the acres, respectively.

## **2001 Fruit Crops Pest Management Practices**

**Overview:** Prior to the 2001 crop year, fruit crop pest management practices data were collected and published separately from the Fruit Chemical Use Survey. The Pest Management Practices 2001 Summary is based on data compiled from respondents participating in the Fruit Chemical Use Survey (FCUS). Producers were first asked how many total acres of fruit crops they grew in 2001, followed by questions regarding the use of specific pest management practices, in a yes/no format. Pests were defined as weeds, insects, and diseases. If the respondent used a specific practice on any fruit crop, it was assumed that the practice was used on all acres of fruit crops. For example, if a producer had 500 acres of various fruit crops, and used field mapping of previous weed problems to assist in making weed management decisions, it was assumed that all 500 acres were mapped.

For this report, each question has been categorized into one of four pest management categories: prevention, avoidance, monitoring, and suppression. The actual questions used to collect these data are shown on pages 168-169.

The data are published in two tables: percent of acres receiving the specific pest management practice, and percent of farms using the specific pest management practice. These percentages are published at the Program States and State levels. For all the crops in this survey, the percentages refer only to farms and fruit acres (bearing and non-bearing included).

**Highlights:** The use of **Tillage/etc. to Manage Pests** was the most widespread pest management practice, used by 76 percent of the fruit farms on 83 percent of the acres. **Scouting for Pests** and **Alternating Pesticides** were used on 81 and 74 percent of the fruit acres, respectively. Fifty-four percent of the farms **Cleaned Implements after Fieldwork** as a prevention practice.

<sup>1</sup> Practice not reported.

**Survey Procedures:** Large screening samples were drawn from the NASS List Sampling Frame. This extensive sampling frame covers all types of farms and accounts for about 82% of all land in farms in the U.S. The screening samples were selected in such a way as to insure that all farms on the list had a possibility of being selected. Farms that were more likely to be producers of crops of interest were more likely to be in the sample. The sampled farms were screened to determine the presence of all the crops of interest. From this subpopulation of operations identified as producing the crop of interest, a subsample of farms was selected in such a way as to insure that each identified producer had an opportunity to be selected. In general, larger farms were more likely to be selected than smaller farms.

**Estimation Procedures:** The chemical applications data, reported by product name or trade name are reviewed within state and across states for reasonableness and consistency. This review compares reported data with manufacturer's recommendations and with data from other farm operators using the same product. Following this review, product information are converted to an active ingredient level. The chemical usage estimates in this publication consist of survey estimates of those active ingredients.

Estimates of the total amount of active ingredient applied are based on the acreage estimates published in the annual NASS report "**Citrus Fruits - 2001 Summary**" [Fr Nt 3-1(01)] released on September 20, 2001 and "**Noncitrus Fruits and Nuts - 2001 Summary**" [Fr Nt 1-3 (01)] released on July 8, 2002. The estimates for total amount applied will not be revised even if there are subsequent revisions to acreage for a given crop.

Detailed data within a table may not multiply across or add down due to independent rounding of the published values.

**Reliability:** The probability nature of the survey provides expansion of data so that the estimates are statistically representative of chemical use on the targeted crops in the surveyed States. The reliability of these survey results are affected by non-sampling errors and sampling variability. The sampling variability, expressed as a percentage of the estimate, is referred to as the coefficient of variation (cv).

Non-sampling errors are errors that occur during a survey process, and unlike sampling variability, are difficult to measure. They may be caused by interviewers failing to follow instructions, poorly worded questions, non-response, problematic survey procedures, or data handling between collection and publication. In these surveys, all survey procedures and analysis were carried out in a consistent and orderly manner to minimize the occurrence of these types of errors.

Variability for estimates of acres treated will be higher than the variability for estimates of application rates. This is because application rates have a narrower range of responses, are recommended by the manufacturer of the product, and are generally followed.

Sampling variability of the estimates differed considerably by chemical and crop. In general, the more often the chemical was applied, the smaller the sampling variability. For example, estimates of use of a commonly used product, such as Carbaryl, exhibit less variability than a more rarely used product. For more commonly used chemicals, cv's will range from 1-30 percent at the U.S. level and 5-65 percent at the State level. Some rarer items will have cv's above 100 percent. These items have insufficient data for publication and these instances are noted.

## Terms and Definitions

**Active ingredient:** The active ingredient is the specific chemical which kills or controls the target pests. Usage data are reported by pesticide product and are converted to an amount of active ingredient. A single method of conversion has been chosen for active ingredients having more than one way of being converted. For example in this report, copper compounds are expressed in their metallic copper equivalent, and others such as 2,4-D and glyphosate are expressed in their acid equivalent.

**Allelopathic:** The release of chemical compounds from a plant that will inhibit the growth of another plant, such as weeds.

**Agricultural chemicals:** Refers to the active ingredients in fertilizers and pesticides.

**Application Rates:** Refer to the average number of pounds of a fertilizer primary nutrient or pesticide active ingredient applied to an acre of land. Rate per acre is the average number of pounds applied in one application. Rate per crop year is the average number of pounds applied counting multiple applications. Number of applications is the average number of times a treated acre receives a specific agricultural chemical.

**Area applied:** Represents the percentage of crop acres receiving one or more applications of a specific agricultural chemical. This report does not contain acre treatments. However, acre treatments can be calculated by multiplying the acres planted by the percent of area applied and the average number of applications.

**Avoidance:** May be practiced when pest populations exist in a field or site but the impact of the pest on the crop can be avoided through some cultural practice. Examples of avoidance tactics include crop rotation such that the crop of choice is not a host for the pest, choosing cultivars with genetic resistance to pests, using trap crops, choosing cultivars with maturity dates that may allow harvest before pest populations develop, fertilization programs to promote rapid crop development, and simply not planting certain areas of fields where pest populations are likely to cause crop failure. Some tactics for prevention and avoidance strategies may overlap.

The following questions were categorized as avoidance practices:

Did you adjust planting or harvesting dates to control pests?

Did you grow a trap crop to help control insects?

**Beneficial Insects:** Insects collected and introduced into locations because of their value in biologic control as prey on harmful insects and parasites.

## Terms and Definitions (continued)

**Chemigation:** Application of an agricultural chemical by injecting it into irrigation water.

**Common name:** An officially recognized name for an active ingredient. This report shows active ingredient by common name.

**Crop year:** Refers to the period immediately following harvest for the previous crop through harvest of the current crop.

**Cultivars:** A horticulturally or agriculturally derived variety of a plant, as distinguished from a natural variety.

**Fertilizer:** Refers to applications of the primary nutrients, nitrogen, phosphate, and potash.

**Fungi:** A lower form of parasitic plant life which often reduces crop production and/or lowers the grade quality of its host.

**Monitoring:** Includes proper identification of pests through surveys or scouting programs, including trapping, weather monitoring, and soil testing where appropriate.

The following questions were categorized as monitoring practices:

Was this crop scouted for pests (weeds, insects or disease) using a systematic method?

Did you use field mapping of previous weed problems to assist you in making weed management decisions?

Did you use soil analysis to detect the presence of soilborne pests or pathogens?

Did you use pheromones to monitor pests by trapping?

Did you use weather monitoring to predict the need for pesticide applications?

**Nematodes:** Microscopic, worm-shaped parasitic animals. Damage to many crops can be severe.

**Pesticides:** As defined by the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), pesticides include any substance or mixture of substances intended for preventing, destroying, repelling or mitigating any pest, and any substance or mixture of substances intended for use as a plant regulator, defoliant, or desiccant.

The four classes of pesticides presented in this report and the pests targeted are: herbicides - weeds, insecticides - insects, fungicides - fungi, and other chemicals - other forms of life. Miticides and nematicides are included as insecticides while soil fumigants, growth regulators, defoliants, and desiccants are included as other chemicals.

## Terms and Definitions (continued)

**Pheromone:** A chemical substance produced by an insect which serves as a stimulus to other individuals of the same species for one or more behavioral responses.

**Prevention:** Is the practice of keeping a pest population from infesting a crop or field. It includes such tactics as using pest-free seeds and transplants, preventing weeds from reproducing, choosing cultivars with genetic resistance to insects or disease, irrigation scheduling to avoid situations conducive to disease development, cleaning tillage and harvesting equipment between fields or operations, using field sanitation procedures, and eliminating alternate hosts or sites for insect pests and disease organisms.

The following questions were categorized as prevention practices:

Did you clean tillage or harvesting implements after completing fieldwork for the purpose of reducing the spread of weeds, diseases or other pests?

Did you remove or plow down crop residues to control pests?

Did you use practices such as tilling, mowing, burning, or chopping of field edges, lanes, ditches, roadways or fence lines to manage pests?

Did you use water management practices, such as controlled drainage or irrigation scheduling, excluding chemigation, to control pests?

**Suppression:** Tactics include cultural practices such as narrow row spacings or optimized in-row plant populations, alternative tillage approaches such as no-till or strip-till systems, cover crops or mulches, or using crops with allelopathic potential in the rotation. Physical suppression tactics may include cultivation or mowing for weed control, baited or pheromone traps for certain insects, and temperature management or exclusion devices for insect and disease management. Biological controls, including mating disruption for insects, could be considered as alternatives to conventional pesticides, especially where long-term control of an especially troublesome pest species can be obtained. Chemical pesticides are important and some use will remain necessary. However, pesticides should be applied as a last resort in suppression systems.

The following questions were categorized as suppression practices:

Did you use scouting data and compare it to university or extension guidelines for infestation thresholds to determine when to take measures to control pests?

Did you use beneficial organisms (insects, nematodes or fungi) to control pests?

Did you use topically applied biological pesticides such as Bt (*Bacillus thuringiensis*), insect growth regulators, neem or other natural products to control pests?

Did you maintain ground covers, mulch or physical barriers to reduce pest problems?

Did you alternate pesticides to keep pests from becoming resistant to pesticides (use pesticides with different mechanisms of action)?

Did you use pheromones to control pests by disrupting mating?

## **Terms and Definitions (continued)**

**Trade name:** A trademark name given to a specific formulation of a pesticide product. A formulation contains a specific concentration of the active ingredient, carrier materials, and other ingredients such as emulsifiers and wetting agents. Some formulation as in the case of pre-mixes, can contain more than one active ingredient.

**Active Ingredients Applied and Publication Status by Program States:** These tables are provided to show all active ingredients reported in the Program States. The Publication Status is determined by confidentiality rules. In order to publish data for an active ingredient, there must be a minimum of five reports for the specific active ingredient at the summary level (by crop, by State or all Program States). If there are five or more reports, then the active ingredient data are published and designated as a "P" in the table. In cases where there are not enough reports to publish usage data for a given active ingredient, an "\*" appears in the table. This means the active ingredient was reported, but there were not a sufficient number of reports. However, there are certain instances where the "Program States" data were suppressed so that a major active ingredient could then be published at an individual State level.

### Trade Name, Common Name, and Pesticide Class

The following is a list of the common name, associated class and trade name of active ingredients in the publication. The classes are herbicides (H), insecticides (I), fungicides (F), and other chemicals (O). This list is provided as an aid in reviewing pesticide data. Pre-mixes are not cataloged. The list is not complete for all pesticides used on fruit crops and NASS does not mean to imply the use of the specific trade name.

<b>Class</b>	<b>Common Name</b>	<b>Trade Name</b>
H	2,4-D	Several
H	2,4-D, Dimeth. salt	Saber, Weedar, Weedaxe
H	2,4-DP, Dimethylamine salt	2,4-D Amine
I	Abamectin	Agri-Mek, Clinch Ant Bait
I	Acephate	Orthene
H	Acetic acid	2,4-D/Esteron
F	Agrobacterium radiobacter	Galltrol
H	Alachlor	Lasso
I	Aldicarb	Temik
O	Aluminum phosphide	Aluminum Phosphide, Fumiphos, Gastoxin, Phostoxin
I	Amitraz	Mitac
O	Ammonium soap	Hinder
F	Ampelomyces quisquales isolate	AQ 10 Biofungicide
F	Anilazine	Dyrene
H	Atrazine	Atrazine
I	Azadirachtin	AZA-Direct, Ecozin, Margosan, Neemix
I	Azinphos-methyl	Azinphos-M, Guthion, Sniper
F	Azoxystrobin	ICIA5504, Abound, Quadris
F	Bacillus subtilis	Serenade
I	Bacillus thuringiensis	Agree, Biobit, Condor, Crymax, Cutlass, Deliver, Dipel, Javelin, Larvo-Bt, MVP, Xentari Basic Copper Sulfate, Bonide Garden Dust, C-O-C-S, Cop-O-Zinc Nu-Cop, Nutra-Spray, Top Cop, Tri-Basic Copper
F	Basic copper sulfate	Zinc Coposil
I	Beauveria bassiana	Mycotrol
F	Benomyl	Benlate
I	Benzoic acid	Intrepid
O	Benzyladenine	Accel, Perlan, Promalin, Typy
I	Bifenazate	Acramide
I	Bifenthrin	Brigade, Capture
O	Brodifacoum	Talon
H	Bromacil	Hyvar X, Krovar
O	Bromadiolone	Maki Paraffinized Rat Bait
I	Buprofezin	Applaud
O	Butenoic acid hydrochloride	Retain
F	Calcium polysulfide	Lime Sulfur Solution, Orthorix Polysul, Sulforix

<b>Class</b>	<b>Common Name</b>	<b>Trade Name</b>
O	Capsaicin	Hot Sauce Animal Repellent
F	Captafol	Difolatan
F	Captan	Agway Fruit Tree Spray, Captan, Captec, Ortho Home Orchard Spray
I	Carbaryl	Agway Fruit Tree Spray, Carbaryl, Sevin
I	Carbofuran	Furadan
O	Carbon	Gas Cartridge Rodenticide, The Giant Destroyer
I	Carbophenothion	Trithion
F	Carboxin	Vitavax
I	Chitin	Clandosan
O	Chlorophacinone	Rozol
O	Chloropicrin	Chloropicrin, Telone, Tri-Clor
F	Chlorothalonil	Bravo, Echo
I	Chlorpyrifos	Chlorpyrifos, Dursban, Lorsban, Nufos
I	Cinnamaldehyde	Valero
H	Clethodim	Prism, Select
I	Clofentezine	Apollo
H	Clopyralid	Curtail, Stinger
F	Copper ammonium complex	Copper-Count-N
F	Copper chloride hydroxide	Agra-cop, Microsperse
F	Copper hydroxide	Blue Shield, Champ, Champion, Kocide, Kop-Hydroxide, Mankocide, Nu-Cop, ProCop
F	Copper oxide	Nordox
F	Copper oxychloride	C-O-C-S, Microsperse
F	Copper oxychloride sulfate	C-O-C-S, Copodust, Oxykop
F	Copper resinate	Tenn-Cop
F	Copper sulfate	Basicop, Bluestone Copper Sulfate
F	Cresol	Gallex
I	Cryolite	Cryolite, Kryocide
O	Cyanamid	Dormex
H	Cyanazine	Bladex
I	Cyd-X Granulovirus	Virosot Bioinsecticide
I	Cyfluthrin	Baythroid
F	Cyprodinil	Switch, Vangard
O	Cytokinins	Cytokin Bioregulator, Cyzer, Foliar Trigger
O	Decenol	Checkmate
O	Decenyl acetate	Checkmate
I	Diazinon	Diazinon, Spectracide Spectracide 25
H	Dichlobenil	Casoron

<b>Class</b>	<b>Common Name</b>	<b>Trade Name</b>
F	Dichlone	Dichlone
O	Dichloropropene	Telone
F	Dicloran	Botran
I	Dicofol	Dicofol, Kelthane
O	Diethyl-2-ethylamine	Ecolyst
I	Diflubenzuron	Dimilin, Micromite
I	Dimethoate	Cygon, Digon, Dimethoate
F	Dimethylphenol	Gallex
F	Dinocap	Karathane
H	Dinoseb	Dinitro
O	Diphacinone	Diphacinone, Ramik
H	Diquat	Diquat
H	Diuron	Direx, Karmex, Krovar
O	Dodecanol	Isomate
F	Dodine	Cyprex, Dodine, Syllit
O	Dodecadien-1-ol	Checkmate, Disrupt, Isomate, NoMate
O	E-8-Dodecenyl acetate	Checkmate, Consep, Isomate
H	EPTC	Eptam

O	Zinc phosphide	Zinc Phosphide
F	Ziram	Ziram

Now I have some questions about pesticide and chemical applications to your bearing fruit acreage before harvest. Please consider all applications made to trees, vineyards or bushes which occurred **after last season's harvest.**

1. Since last year's (2000) harvest, did you use **herbicides** on any of your fruit acreage? .....  YES  NO
2. Since last year's (2000) harvest, did you use **insecticides, nematicides or miticides** on any of your bearing fruit acreage? .....  YES  NO
3. Since last year's (2000) harvest, did you use any **fungicides** on any of your bearing fruit acreage? .....  YES  NO
4. Since last year's (2000) harvest, did you use any other chemicals such as .....  YES  NO
5. **[ENUMERATOR ACTION: Are items 1 - 4 all NO?]**

YES - [Go to Section D, page 10.]  NO - [Go to item 6, on next page.]

For pesticides not listed on card, specify

Line # Pesticide Type Tradename & Formulation Form Purchased EPA Number  
(Herb., Insect., Fung., etc.) (Liquid or Dry)

Now I have some questions about pest management practices you may have used on any of the total fruit acres on this operation (including both target and non-target fruit crops grown).

By pests, we mean insects, weeds, and diseases.

T-	TABLE	LINE
0	000	00

- | 1.  | Was any of your fruit acreage scouted for pests using a systematic method? .....   | YES = 1 | CODE<br>446 |
|-----|--|---------|-------------|
| 2.  | Were electronic or written records kept to track the activity or numbers of different pests? .....   | YES = 1 | CODE<br>447 |
| 3.  | Did you use scouting data and compare it to university or extension guidelines for infestation thresholds to determine when to take measures to control pests? .....               | YES = 1 | CODE<br>448 |
| 4.  | Did you use field mapping of previous weed problems to assist you in making weed management decisions? .....   | YES = 1 | CODE<br>449 |
| 5.  | Did you use soil analysis to detect the presence of soilborne pests or pathogens? .....  | YES = 1 | CODE<br>450 |
| 6.  | Did you use topically applied biological pesticides such as Bt ( <i>Bacillus thuringiensis</i> ), insect growth regulators, neem or other natural products to control pests? ..... | YES = 1 | CODE<br>452 |
| 7.  | Did you release beneficial organisms (insects, nematodes or fungi) to control pests? .....   | YES = 1 | CODE<br>453 |
| 8.  | Did you maintain ground covers, mulches or physical barriers to reduce pest problems? .....  | YES = 1 | CODE<br>454 |
| 9.  | Did you use practices such as tilling, mowing, burning, or chopping of field edges, lanes, ditches, roadways or fence lines to manage pests? .....                                 | YES = 1 | CODE<br>455 |
| 10. | Did you remove crop residues (including drops, rotting fruit, and/or debris) to control pests? .....   | YES = 1 | CODE<br>456 |
| 11. | Did you clean equipment and/or implements after completing field work for the purpose of reducing the spread of weeds, diseases or other pests? .....                              | YES = 1 | CODE<br>457 |
| 12. | Did you use water management practices, such as controlled drainage or irrigation scheduling, excluding chemigation, to control pests? .....                                       | YES = 1 | CODE<br>458 |
| 13. | Did you adjust planting or harvesting dates to control pests? .....  | YES = 1 | CODE<br>460 |

### CHANGE IN OPERATION

**ENUMERATOR NOTE:** Complete this section only if items 1 through 4 on the face page are "NO".

1. Is anyone else now operating the land you [operation on face page] formerly operated?

**NO** - [Complete this questionnaire.]

**YES** - [Enter code 1, complete information to the right for new operator and read enumerator note below.] .....

**CODE**

023

Name	
Address	
Phone (_____)	
<b>POID</b> .....	024

[**ENUMERATOR NOTE:** If the operation on face page was in business any part of the 2001 crop year, complete this questionnaire for the part of the year during which the operation did business. If the operation was out of business for the entire 2001 crop year, conclude interview.]

## Report Features

**Released August 2, 2002 by the National Agricultural Statistics Service (NASS), Agricultural Statistics Board, U.S. Department of Agriculture. For information on "Agricultural Chemical Usage" call (202) 720-6146, office hours 7:30 a.m. to 4:00 p.m. ET.**

The next "Agricultural Chemical Usage" report will be released October 2, 2002. This report will cover agricultural chemical use of restricted use pesticides for the 2001 crop year for field crops, fruit and dairy cattle in major states.

The next "Agricultural Chemical Usage" report for fruit crops will be released in July 2004. This report will cover agricultural chemical use for the 2003 crop year for major states.

Listed below are persons within the National Agricultural Statistics Service to contact for additional information.

Mark Aitken, Environmental Statistician (202) 720-9525

Norman Bennett, Head, Environmental and Demographics Section (202) 720-0684

Linda Hutton, Chief, Environmental, Economics and Demographics Branch (202) 720-6146

The United States Department of Agriculture (USDA) prohibits discrimination in all its programs on the basis of race, color, national origin, gender, religion, age, disability, political beliefs, sexual orientation, and marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (braille, large print, audiotape, etc.) should contact the USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 1400 Independence Avenue, SW, Washington, D.C., 20250-9410, or call 202-720-5964 (voice or TDD). USDA is an equal opportunity provider and employer.

## ACCESS TO REPORTS!!

---

For your convenience, there are several ways to obtain NASS reports, data products, and services:

### INTERNET ACCESS

All NASS reports are available free of charge on the worldwide Internet. For access, connect to the Internet and go to the NASS Home Page at: <http://www.usda.gov/nass/>. Select "Today's Reports" or Publications and then Reports by Calendar or Publications and then Search, by Title or Subject.

### E-MAIL SUBSCRIPTION

There are two options for subscribing via e-mail. All NASS reports are available by subscription free of charge direct to your e-mail address. 1) Starting with the NASS Home Page at <http://www.usda.gov/nass/>, click on **Publications**, then click on the **Subscribe by E-mail** button which takes you to the page describing e-mail delivery of reports. Finally, click on [Go to the Subscription Page](#) and follow the instructions. 2) If you do NOT have Internet access, send an e-mail message to: [usda-reports@usda.mannlib.cornell.edu](mailto:usda-reports@usda.mannlib.cornell.edu). In the body of the message type the word: **list**.

### AUTOFAX ACCESS

NASSFax service is available for some reports from your fax machine. Please call 202-720-2000, using the handset attached to your fax. Respond to the voice prompts. Document 0411 is a list of available reports.

---

### PRINTED REPORTS OR DATA PRODUCTS

**CALL OUR TOLL-FREE ORDER DESK: 800-999-6779 (U.S. and Canada)**  
Other areas, please call 703-605-6220      FAX: 703-605-6900  
(Visa, MasterCard, check, or money order acceptable for payment.)

---

### ASSISTANCE

For **assistance** with general agricultural statistics or further information about NASS or its products or services, contact the **Agricultural Statistics Hotline** at **800-727-9540**, 7:30 a.m. to 4:00 p.m. ET, or e-mail: [nass@nass.usda.gov](mailto:nass@nass.usda.gov).
